We are beginning to see the potential of generative artificial intelligence (AI) beyond the "Magnificent 7" and the tech sector.

## 2023: The year of generative artificial intelligence (AI)

The recent emergence of **generative artificial intelligence (AI)** is a clear example of the massive, rapid adoption of a technological innovation that is having a major impact on society and all sectors of the economy<sup>1</sup>.

**ChatGPT** is a generative AI tool that has catalysed this revolution by offering easy access to this disruptive technology, although there are other applications based on this technology that enable computers to generate and process not only the written word, but also voice, image and video.

Unlike previous innovation cycles, this time the **technology giants are the initial beneficiaries**. Specifically, the returns are being concentrated mostly **in the "Magnificent 7,"** seven large-cap tech and media companies, largely because of their exposure to generative AI. **In 2023, artificial intelligence-related indices appreciated by an average of 34%, compared with 21.77% by the MSCI World index and 24.23% by S&P 500 index<sup>2</sup>.**

In terms of individual companies, the most outstanding case is **Nvidia**, which dominates about 74%<sup>3</sup> of the market in semiconductors and GPUs (graphics processing units) that are capable of performing accelerated computing — fundamental for training artificial intelligence models. Its **market capitalisation exceeds USD2 trillion<sup>2</sup>** and it is viewed as one of the companies that could benefit most from the adoption of this technology<sup>5</sup>.

### What is generative AI?

Generative AI is an umbrella term for a form of machine learning (ML) called "deep learning". It can create new content such as text, images, music, audio and videos.

This type of AI has recently made a huge leap forward in the way it learns. Most of the early ML models involved supervised learning, where humans were needed to classify the data. For example, identifying a social media post as "political". But the latest advances in generative AI are based on unsupervised learning, in which the model makes its own predictions and calculations based on the input data. The machine has advanced from being able to identify a car in an image to creating an image of a car.

It can be trained to learn human language, programming languages, art, chemistry, biology or any complex subject.

### Why is generative AI important?

Generative AI applications can help reinvent most customer experiences and applications, create unprecedented new applications, and help customers reach new levels of productivity.

**According to Goldman Sachs<sup>6</sup>, generative AI could increase the global gross domestic product (GDP) by 7% (i.e. nearly USD 7 trillion). They also project that it could increase productivity growth by 1.5 percentage points over 10 years.** This would, in turn, raise the compound annual growth rate of the the S&P 500's earnings per share (EPS) to 5.4% over the next 20 years, up from the 4.9% projected currently by their discounted dividends model. This suggests that the S&P 500 would be worth 9% more than it is today.

Some of the benefits of generative AI include improving customer interactions, optimising business processes, improving offerings, and increasing productivity.

## Rapid adoption of generative AI

Generative AI is one of the most rapidly adopted technological innovations ever, having aroused the interest of the majority of businesspeople: people from all regions, industries and generations are using generative AI in the workplace. According to a McKinsey survey:

Of respondents say they have been exposed to generative AI (at work or otherwise).

Say the use of generative AI is already on the board's agenda.

Of respondents expect generative AI to cause significant or disruptive changes in their industry within three years.

Of AI users expect higher productivity to be the greatest benefit of using AI.

Other expected benefits include

- improved efficiency (20%)
- task automation (15%)
- better quality (8%)
- lower costs (3%)

## Benefits of generative AI

### Cost cuts

On average, 42% of respondents reported cost reductions of 10% or greater due to adopting AI. The largest cost reductions are in service operations (54%), marketing and sales (55%) and manufacturing (66%).

### Improved offering

For those with the best outcomes from AI<sup>1</sup>, the main goal of generative AI is to increase the value of offerings by integrating AI-based features or insights.

### Higher profits

On average, 59% of respondents reported a more than 5% increase in profit due to AI; the largest revenue increases were in product/service development (65%), marketing and sales (61%), and service operations (57%).

### Higher productivity

Generative AI is expected to increase productivity in knowledge work, such as document writing, text summarisation, product design creation, and customer service chatbots.

### New revenue sources

23% of the top performers in AI<sup>1</sup> cite creating new business or revenue streams as the primary goal of using generative AI.

<sup>1</sup> Companies where more than 20% of EBIT (Earnings before Interest and Taxes) comes from artificial intelligence.

Source: McKinsey, August 2023: 'The state of AI in 2023: Generative AI's breakout year'. Survey conducted in mid-April 2023. McKinsey's annual survey examines the current state of AI, focusing this year on the rise of generative AI. The report provides information on the level adoption, impacts and outlook based on a survey of 1,684 respondents around the world in sectors including technology, financial services, healthcare, consumer goods, and energy.

# Projections for the future of generative AI

It's hard to predict how generative AI will play out, but it is likely to evolve rapidly and **we believe it can become a key part of AI-driven transformation and innovation**. We expect to see improvements in the quality and diversity of the content it generates, new types of generative models, and broader application in such **industries as healthcare, finance and transportation**.

According to McKinsey<sup>1</sup>, generative AI is poised to unleash a powerful wave of productivity growth that is likely to affect every industry and **could add as much as USD 4.4 trillion to the global economy** each year across the 63 use cases that they examine.

Generative AI is expected to affect all industries, although four business functions will likely account for 75% of the total annual value it can deliver: **marketing and sales, customer operations, software engineering, and research and development**<sup>1</sup>.

## The generative AI market could grow by 27% per year for the next 10 years

Size of the market in generative AI (between 2023 and 2032, USD billion).

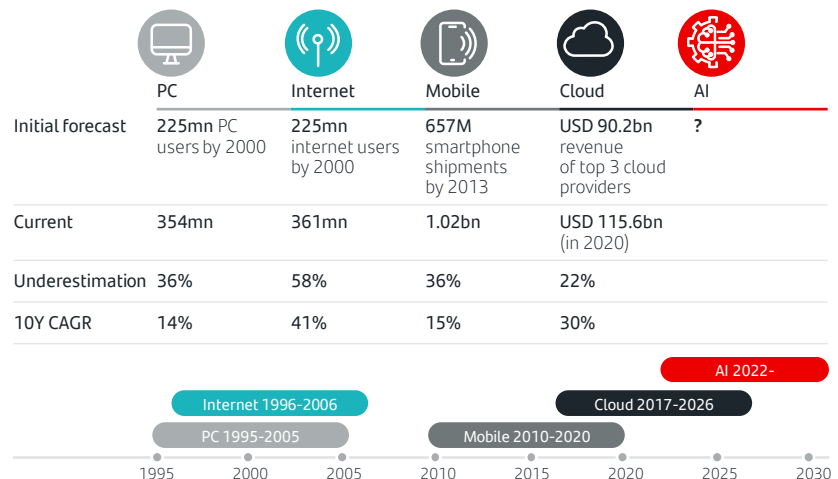

Source: Precedence Research, Dec. 2022.  
Compound annual growth rate = 27.02% between 2023 and 2032.

According to PwC<sup>2</sup>, the greatest economic benefits of AI will be obtained in **China (USD 7 trillion in 2030) and North America (USD 3.7 trillion)** — a total of USD 10.7 trillion, representing almost 70% of the global economic impact.

**The market is currently underestimating the impact of AI.** On average, Wall Street is underestimating the opportunity for change by 38%:
